**Subject:** Willamette River

I prefer option G, but I think it is insufficient unless this additional point is also addressed.

The upland sources, particularly the tank farms located in the Linton/Willbridge area need to be controlled to prevent further contamination or re-contamination of the river, with specific attention to earthquakes, flooding and climate change. Ensure that financial tools are in place to cover possible re-contamination events, such as responsible parties acquiring assurance/surety bonds, based on inflation into perpetuity to address re-contamination of the river.

Thank you, (b) (6)
